Running Example: McCarthy's Function

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Running Example: McCarthy's Function

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Actual behavior:

First Attempt: Direct Representation

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

```
Fixpoint mccarthy (n:nat) {struct n} : nat :=  
  match le_gt_dec n 100 with  
  | left _ => mccarthy (mccarthy (11+n))  
  | right _ => n-10  
end.
```

First Attempt: Direct Representation

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

```
Fixpoint mccarthy (n:nat) {struct n} : nat :=
  match le_gt_dec n 100 with
  | left _ => mccarthy (mccarthy (11+n))
  | right _ => n-10
end.
```

- ▶ problem: $11+n$ is not structurally smaller than n

First Attempt: Direct Representation

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

```
Fixpoint mccarthy (n:nat) {struct n} : nat :=
  match le_gt_dec n 100 with
  | left _ => mccarthy (mccarthy (11+n))
  | right _ => n-10
  end.
```

- ▶ problem: $11+n$ is not structurally smaller than n
- ▶ problem: `mccarthy (11+n)` is not structurally smaller than n

First Attempt: Direct Representation

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

```
Fixpoint mccarthy (n:nat) {struct n} : nat :=  
  match le_gt_dec n 100 with  
  | left _ => mccarthy (mccarthy (11+n))  
  | right _ => n-10  
end.
```

- ▶ problem: $11+n$ is not structurally smaller than n
- ▶ problem: $\text{mccarthy } (11+n)$ is not structurally smaller than n
- ▶ **problem: any decreasing metric will more complex than the function itself**

Solution #1: Set-bounded recursion

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

```
Fixpoint mccarthy ( n:nat) {struct n} : nat :=
```

```
  match le_gt_dec n 100 with
  | left _ => mccarthy      (mccarthy      (11+n))
  | right _ =>      (n-10)
  end.
```

Solution #1: Set-bounded recursion

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Notation "a <<< b" :=

```
(match b with None => None | Some x => a x end)
(at level 100).
```

```
Fixpoint mccarthy (d n:nat) {struct d} : option nat :=
  match d with
  | 0      => None
  | (S d') =>
    match le_gt_dec n 100 with
    | left  _ => mccarthy d' <<< (mccarthy d' (11+n))
    | right _ => Some (n-10)
    end end.
```

Typical Solution: Set-bounded evaluation

- ▶ good: determination of recursion bound is separated from function definition

Typical Solution: Set-bounded evaluation

- ▶ good: determination of recursion bound is separated from function definition
- ▶ bad: recursion bound is in Set; will be included in extracted code

Typical Solution: Set-bounded evaluation

- ▶ good: determination of recursion bound is separated from function definition
- ▶ bad: recursion bound is in Set; will be included in extracted code

Later we modified the whole formalization and we used the Prop-sorted accessibility. Our tests showed a 25% to 30% decrease in both time and memory usage of the extracted algorithms.

– Niqui and Bertot (2003)

Other Approaches

- ▶ Domain predicate
 - ▶ multi-constructor type (in `Set`) [Bove, Capretta 2001]
 - ▶ often with Dybjer's simultaneous inductive-recursive definitions
- ▶ Accessibility predicate
 - ▶ single-constructor predicate (in `Prop`) [`Coq.Init.Wf`]
- ▶ Extensions to the type theory (Υ , bar types, etc)

Proposed Solution: A Coinductive Computation Monad

```
CoInductive Computation (A:Set) : Type :=  
  | Return  : A                -> #A  
  | Bind    : (A->#A) -> #A -> #A  
  where "# A" := (Computation A).
```

Programming mccarthy Using the Monad

```
CoFixpoint mccarthy (n:nat) : #nat :=  
  match le_gt_dec n 100 with  
  | left _ => Bind mccarthy (mccarthy (11+n))  
  | right _ => Return (n-10)  
end.
```

- ▶ Use of CoFixpoint circumvents usual syntactic check of recursive references.
- ▶ Making monad operators *constructors* of the coinductive type ensures generativity.

Termination Proofs

```
Inductive TerminatesWith : #A -> A -> Prop :=
| TerminateReturnWith :
  forall (a:A),
    TerminatesWith (Return a) a

| TerminateBindWith :
  forall (a:A) (a':A) (f:A->#A) (c:#A),
    (TerminatesWith c a)
  -> TerminatesWith (f a) a'
  -> TerminatesWith (Bind f c) a'
```

Termination Proofs

```
Inductive TerminatesWith : #A -> A -> Prop :=  
| TerminateReturnWith :  
  forall (a:A),  
    TerminatesWith (Return a) a  
  
| TerminateBindWith :  
  forall (a:A) (a':A) (f:A->#A) (c:#A),  
    (TerminatesWith c a)  
  -> TerminatesWith (f a) a'  
  -> TerminatesWith (Bind f c) a'
```

Termination Proofs

```
Inductive TerminatesWith : #A -> A -> Prop :=  
| TerminateReturnWith :  
  forall (a:A),  
    TerminatesWith (Return a) a  
  
| TerminateBindWith :  
  forall (a:A) (a':A) (f:A->#A) (c:#A),  
    (TerminatesWith c a)  
  -> TerminatesWith (f a) a'  
  -> TerminatesWith (Bind f c) a'
```

Termination Proofs

```
Inductive TerminatesWith : #A -> A -> Prop :=
| TerminateReturnWith :
  forall (a:A),
    TerminatesWith (Return a) a

| TerminateBindWith :
  forall (a:A) (a':A) (f:A->#A) (c:#A),
    (TerminatesWith c a)
  -> TerminatesWith (f a) a'
  -> TerminatesWith (Bind f c) a'
```

Termination Proofs

```
Inductive TerminatesWith : #A -> A -> Prop :=  
| TerminateReturnWith :  
  forall (a:A),  
    TerminatesWith (Return a) a  
  
| TerminateBindWith :  
  forall (a:A) (a':A) (f:A->#A) (c:#A),  
    (TerminatesWith c a)  
  -> TerminatesWith (f a) a'  
  -> TerminatesWith (Bind f c) a'
```

Termination Proofs

```
Inductive TerminatesWith : #A -> A -> Prop :=
| TerminateReturnWith :
  forall (a:A),
    TerminatesWith (Return a) a

| TerminateBindWith :
  forall (a:A) (a':A) (f:A->#A) (c:#A),
    (TerminatesWith c a)
  -> TerminatesWith (f a) a'
  -> TerminatesWith (Bind f c) a'
```

Note that facts about the return value (a) of one computation (c) may be used in the termination argument for some other computation (f a).

Base Case: $M(101)$ terminates

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

First Induction: $90 \leq n \leq 100 \Rightarrow M(n) = M(n + 1)$

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Second Induction: $90 \leq n \leq 100 \Rightarrow M(n) = 91$

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Third Induction: each “block of eleven” same

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Third Induction: each “block of eleven” same

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Third Induction: each “block of eleven” same

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Third Induction: each “block of eleven” same

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Therefore $M(n)$ terminates for $n \leq 100$

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Termination for $n > 100$ is immediate

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Summary of Termination Argument for `mccarthy`

- ▶ We can show by *downward* induction that for $90 \leq n \leq 100$, $M(n) = M(n + 1)$ (taking $M(100) = M(101)$ as the base case).
- ▶ By a second induction we can show that $M(n) = 91$ over this range.
- ▶ By a third downward induction we can show that $M(n) = 91$ holds for each chunk of eleven integers less than 100, using the initial chunk $90 \leq n \leq 100$ as the base case.
- ▶ Therefore the function terminates for $n \leq 100$.
- ▶ Termination for $n > 100$ is immediate from the definition of the function.

Summary of Termination Argument for `mccarthy`

- ▶ We can show by *downward* induction that for $90 \leq n \leq 100$, $M(n) = M(n + 1)$ (taking $M(100) = M(101)$ as the base case).
- ▶ By a second induction we can show that $M(n) = 91$ over this range.
- ▶ By a third downward induction we can show that $M(n) = 91$ holds for each chunk of eleven integers less than 100, using the initial chunk $90 \leq n \leq 100$ as the base case.
- ▶ Therefore the function terminates for $n \leq 100$.
- ▶ Termination for $n > 100$ is immediate from the definition of the function.

Unlike metric-based techniques, the proof of termination using a coinductive monad can follow the conventional prose argument.

Proving forall n, Terminates (mccarthy n)

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

We can show by *downward* induction that for $90 \leq n \leq 100$, $M(n) = M(n + 1)$ (taking $M(100) = M(101)$ as the base case).

```
Lemma mccarthy_is_m_of_n_plus_1_for_90_n_100 :  
  forall n k:nat,  
    90 <= n <= 100  
    -> TerminatesWith (mccarthy (n+1)) k  
    -> TerminatesWith (mccarthy (n )) k.
```

Proving forall n, Terminates (mccarthy n)

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

By a second induction we can show that $M(n) = 91$ over this range.

```
Lemma mccarthy_n_is_91_for_90_n_100 :  
  forall n:nat,  
    90 <= n <= 100  
    -> TerminatesWith (mccarthy n) 91.
```

Proving forall n, Terminates (mccarthy n)

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

By a third downward induction we can show that $M(n) = 91$ holds for each chunk of eleven integers less than 100, using the initial chunk $90 \leq n \leq 100$ as the base case.

```
Lemma mccarthy_n_is_91_for_blocks_of_11 :  
  forall k:nat,  
    100 > k*11  
  -> forall n:nat,  
    90-k*11 <= n <= 100-k*11  
    -> TerminatesWith (mccarthy n) 91.
```

Proving forall n, Terminates (mccarthy n)

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Therefore the function terminates for $n \leq 100$.

```
Lemma mccarthy_terminates_for_n_le_100 :  
  forall n:nat,  
    n <= 100  
    -> TerminatesWith (mccarthy n) 91.
```

Proving forall n, Terminates (mccarthy n)

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Termination for $n > 100$ is immediate from the definition of the function.

```
Lemma mccarthy_terminates_for_n_gt_100 :  
  forall n:nat,  
    n > 100  
    -> Terminates (mccarthy n).
```

Proving forall n, Terminates (mccarthy n)

$$M(n) = \begin{cases} n - 10 & \text{if } n > 100 \\ M(M(n + 11)) & \text{if } n \leq 100 \end{cases}$$

Therefore, mccarthy is total.

```
Theorem mccarthy_terminates :  
  forall n:nat,  
    -> Terminates (mccarthy n).
```

Evaluation and Extraction

```
eval : forall (A:Set) (c:#A) (t:Terminates c), A
```

Functions produced by `eval` yield efficient extractions; the `Terminates` term (Prop bound) is completely omitted.

```
bounded_eval :  
  forall (A:Set) (c:#A) (n:nat), option A
```

Summary So Far

- ▶ We can represent potentially-nonterminating computations
- ▶ We can write proofs about the properties (such as termination) of such computations,
 - ▶ Proofs can be used to convert a computation to a function (via `eval`)
 - ▶ Proofs are in `Prop`
 - ▶ Proofs are conventional (follow prose)
 - ▶ Proofs are “after the fact”
- ▶ Coq’s extraction mechanism produces efficient code for applications of `eval`.

Prior work: [Capretta 2005]

Different encoding of computations as coinductive values; closer connection to operational semantics:

```
CoInductive Computation (A:Set) : Type :=  
  | Return  : A -> #A  
  | Step    : #A -> #A  
  where "# A" := (Computation A).
```

```
CoFixpoint bind (A B:Set)(f:A->#B)(x:#A) : #B :=  
  match x with  
  | Return a => f a  
  | Step x'  => Step (bind A B f x')  
  end.
```

Prior work: [Capretta 2005]

Different encoding of computations as coinductive values; closer connection to operational semantics:

```
CoInductive Computation (A:Set) : Type :=  
  | Return  : A -> #A  
  | Step    : #A -> #A  
  where "# A" := (Computation A).
```

- ▶ Disadvantage: `bind` is no longer a constructor, so programs with nested recursion fail the generativity requirement.

Prior work: [Capretta 2005]

Different encoding of computations as coinductive values; closer connection to operational semantics:

```
CoInductive Computation (A:Set) : Type :=  
  | Return  : A -> #A  
  | Step    : #A -> #A  
  where "# A" := (Computation A).
```

- ▶ Disadvantage: `bind` is no longer a constructor, so programs with nested recursion fail the generativity requirement.

Generalizing to Different Range/Domain

```
CoInductive Computation (A:Set) : Type :=
| Return  :          A          -> #A
| Bind    :          (A->#A) -> #A -> #A.
  where "# A" := (Computation A).
```

Generalizing to Different Range/Domain

```
CoInductive Computation (A:Set) : Type :=  
  | Return   :                A                -> #A  
  | Bind     : forall (B:Set), (B->#A) -> #B -> #A.  
  where "# A" := (Computation A).
```

- ▶ Proof of eval safety requires JMeq axiom [McB00] in this case

Mutual Recursion

```
CoFixpoint isEven (isOdd:nat->#bool) (n:nat) : #bool :=
  match n with
  | 0      => Return true
  | (S n') => x <- isOdd n';
             Return (negb x)
end.
```

```
CoFixpoint isOdd (isEven:nat->#bool) (n:nat) : #bool :=
  match n with
  | 0      => Return false
  | (S n') => x <- isEven n';
             Return (negb x)
end.
```

```
CoFixpoint isEven' := (kludge isEven) isOdd'
with      isOdd'   := (kludge isOdd)  isEven'
with      kludge   := (fun x=>x).
```

Higher-Order Computations

CoFixpoint foldc

```
(A B:Set)(la:list A)(b:B)(f:A->B->(#B)) : #B :=  
match la with  
| nil           => Return b  
| (cons a la') => b' <- f a b  
                ; foldc A B la' b' f  
end.
```

First-Class Termination Proofs

```
Lemma foldc_termination :  
  forall  
    (A B:Set)  
    (la:list A)  
    (b0:B)  
    (f:A->B->#B),  
  
    (forall (a:A)(b:B),  
      (In a la) ->  
      (Terminates (f a b)))  
  
  -> Terminates (foldc la b0 f).
```

Thank you
